Full unrestricted work rights in Australia, no sponsorship required.

Temporary Graduate visa (subclass 485) valid to March 2029. Available immediately. Australian Class C driver licence.

SUMMARY

Data analyst with a Master of Data Science from RMIT. I clean and check operational data that people do not trust, build the models and forecasts behind it, and turn it into Power BI reporting a team can act on.

Most of my work has been asset, facilities and healthcare data: cleaning large asset registers, building condition based remaining life logic and multi year capital forecasts, and checking them against a second source before they reach management. I have also done the field end of it, capturing and condition rating 1,500 plus assets on site over 11 days and coordinating a three person inspection team.

SKILLS

Reporting and BI: Power BI, DAX, Power Query, data modelling, dashboard design, KPI reporting, Excel

Data: SQL, PostgreSQL, Python (pandas, NumPy), R (tidyverse, ggplot2), data cleaning, validation, reconciliation, ETL pipelines, exploratory analysis

Asset and operations data: asset registers, condition rating 1 to 5, asset hierarchy and classification, field data capture, remaining life logic, multi year capital forecasting

Delivery: requirements gathering, process mapping, UAT, defect tracking, technical documentation, Agile, stakeholder and management reporting

Tools: Git, GitHub Actions, REST APIs, Power Apps, SharePoint, Fulcrum field capture

EXPERIENCE

SRP Global Consultancy

April 2026 to September 2026

Business Analyst (Jul 2026 to Sep 2026), promoted from Data Analyst, Intern (Apr 2026 to Jul 2026). Melbourne VIC.

- Cleaned, standardised and validated large asset register datasets full of sparse and unreliable fields, writing down the cleaning decision column by column so the figures could be defended later.
- Built condition based remaining life logic and replacement timing models, then annual and cumulative capital forecast tables, and tested alternative spread assumptions rather than reporting a single number.
- Built Power BI models with Power Query transformations and DAX measures, filterable by site, facility, area, category and asset element.
- Reconciled internally built forecasts against an external BI output and investigated where replacement years and forecast spread disagreed, instead of accepting whichever result suited.
- Used Python for validation and quality checks across large operational datasets.
- Wrote down the assumptions and limits behind reporting given to management, so forecasts were read with their uncertainty rather than as settled figures.
- Built the work order platform the operational data comes from, including its reporting layer, so the data model and the reports on top were designed together.

Sydney deployment, asset verification programme, August 2026

- Captured and condition rated 1,500 plus asset records over 11 field days across heritage commercial buildings, retail, hotel amenities, plant rooms, pedestrian footbridges, harbourside parks and public domain.
- Consolidated 4,900 plus reported team captures into a daily progress view and authored the daily report to management covering coverage, volumes, blockers and open scope questions.
- Coordinated a three person inspection team day to day: morning stand ups, site allocation, and splitting building levels so coverage advanced without duplication.
- Drove the data quality controls: recovered draft records that were at risk of automatic deletion, moved the team onto individual accounts so every record carried correct authorship, and created missing levels in the location hierarchy so inspection could continue.
- Flagged that combined team counts contained overlap and required unique totals be reconciled from system records before management treated them as final.
- Turned a client scope of works briefing into a 17 rule field instruction set so three inspectors classified assets the same way from day one.

Woofya

July 2025 to November 2025

Data Analyst Intern (RMIT Work Integrated Learning). Melbourne VIC, hybrid. Work featured at VET Expo 2025.

- Built Python and SQL pipelines pulling from REST API and database sources into reporting ready datasets, replacing manual spreadsheet reporting.
- Cleaned, validated and structured raw operational records, which made the dashboards reliable enough for the team to act on.
- Built the dashboard and reporting screens so stakeholders could see operational patterns without having to ask anyone.

Thoughtstream Innovation

July 2022 to August 2022

Web Development Intern. Bengaluru, India.

- Front end components across a SaaS platform and CRM documentation workflows. First exposure to code review and shipping into someone else's production.

PROJECTS

RBA Cash Rate Dashboard. Power BI dashboard on the Australian cash rate from 1990 to now, using DAX time intelligence measures, period comparison visuals and financial KPIs. Public: github.com/Hemanth-Gowda23/RBA-Cash-Rate-Dashboard

Automated multi source ETL pipeline. Python pipeline that ingests records from public APIs, deduplicates against persistent state, scores each entry with a weighted keyword engine and emails a ranked digest. Scheduled twice daily on GitHub Actions, no stored credentials.

Smart Sprouts, IoT water management. Fuzzy logic irrigation system for vertical farming using Raspberry Pi and live sensors. Published by IEEE and recognised by the Karnataka State Council for Science and Technology.

EDUCATION

Master of Data Science, RMIT University, Melbourne. February 2024 to December 2025.

Key subjects: Machine Learning (High Distinction), Data Science Postgraduate Project (High Distinction), Practical Data Science with Python, Data Wrangling, Applied Analytics, Data Visualisation and Communication, Time Series Analysis (the last four in R), Big Data Processing, Cloud Computing, Data Mining.

Bachelor of Engineering, Information Science and Engineering, Atria Institute of Technology (Visvesvaraya Technological University), Bengaluru. August 2019 to June 2023. First Class.

Key subjects: Database Management Systems, Big Data Analytics, Artificial Intelligence and Machine Learning, Application Development using Python, Software Testing, Information Management Systems.

CERTIFICATIONS AND RECOGNITION

Deloitte Australia Data Analytics Job Simulation, Forage, August 2025

McKinsey Forward Program, 2025

IEEE publication, Smart Sprouts, co-author, October 2023

KSCST 46th Student Project Programme, recognised, 2022 to 2023

REFEREES
